

Cornell Notes: CRISP-DM Framework

Cue / Keywords	Notes
CRISP-DM	- Cross Industry Standard Process for Data Mining. - Definition: Base methodology/process model for data science projects. - Purpose: Describes project phases, tasks, and their relationships.
Phase 1 & 2	- 1. Business Understanding: Identifies objectives/scope; defines the core problem. - 2. Data Understanding: Gathering relevant data based on business needs from multiple sources.
Phase 3 & 4	- 3. Data Preparation: Building final dataset for modeling; identifying required dimensions/variables. - 4. Modelling: Applying analytical/algorithmic techniques (e.g., clustering, classification); analysts select approaches.
Phase 5 & 6	- 5. Evaluation: Validating model accuracy and business fit; ensuring project alignment with initial question. - 6. Deployment: Utilizing model results for business value; integrating outputs into systems or stakeholder reports.

Summary

CRISP-DM (Cross Industry Standard Process for Data Mining) is the foundational methodology for data science projects. It consists of a 6-step process: Business Understanding, Data Understanding, Data Preparation, Modelling, Evaluation, and Deployment. This framework ensures that data mining efforts are aligned with business objectives from conception to implementation.
