

**What did you
learn from the
case studies?**

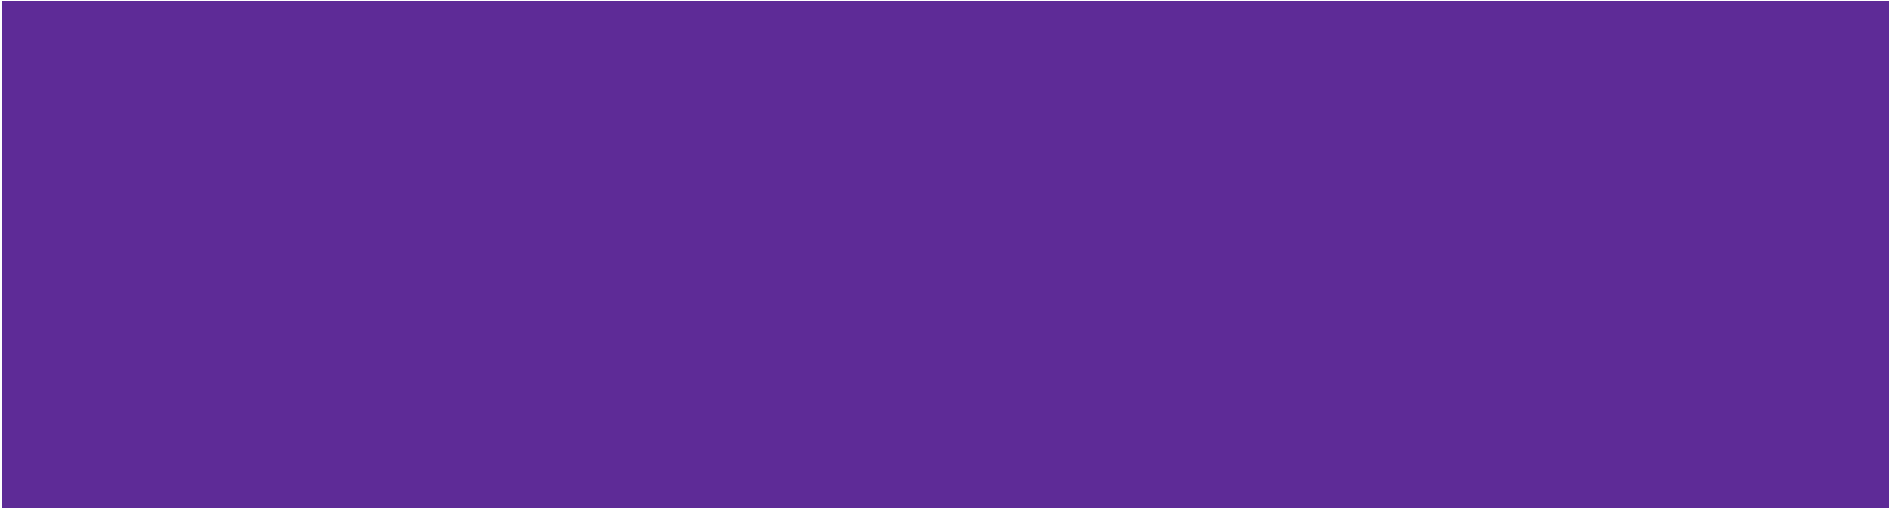

There's a disconnect!

Fig. 1.2 The critical area where information needs to be managed

The Information Management Body of Knowledge (IMBOK)

IT. 412

The challenge is to find the connections

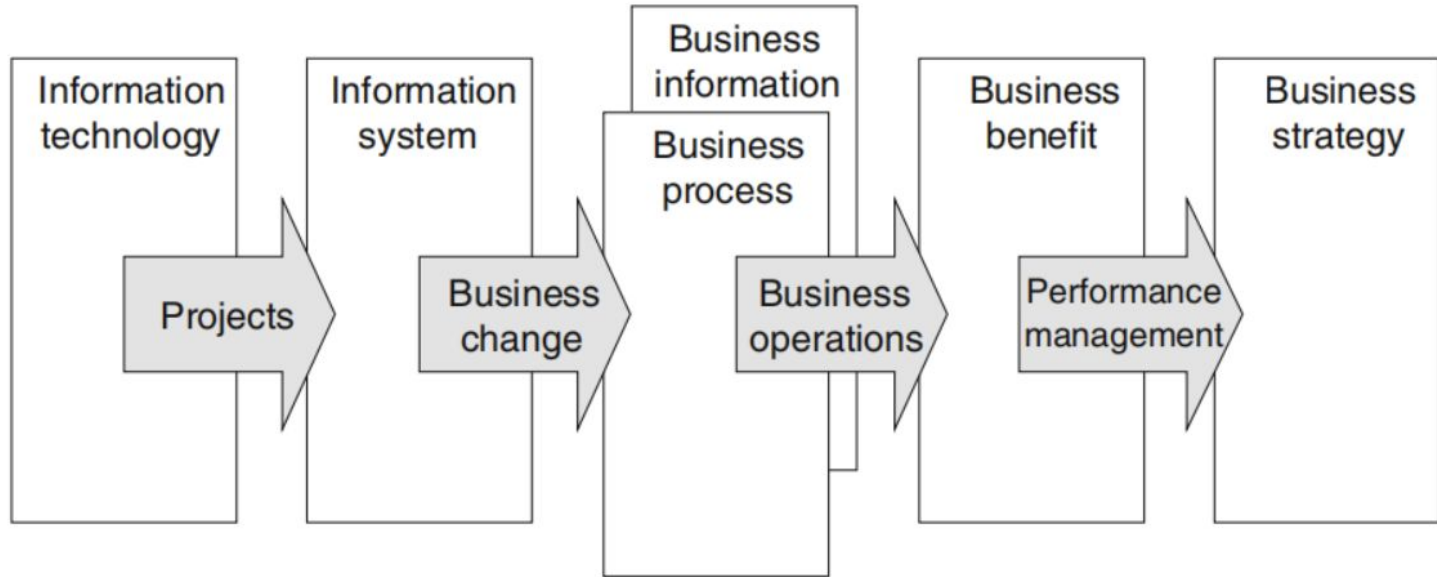

Fig. 2.1 The Information Management Body of Knowledge framework (simplified)

Information Technology

This area involves managing raw technical components such as hardware, software, database systems, and communications networks. These components serve as the basic building blocks that must be engineered into usable systems to serve organizational needs.

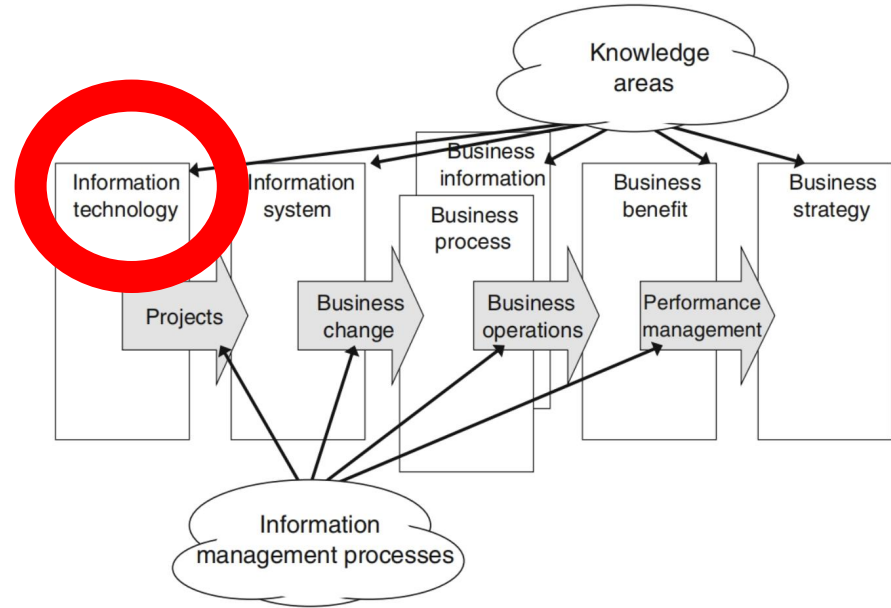

Fig. 2.2 Six management domains, four intersections of necessary alignment

Information Systems

These systems represent the totality of technological and human components working together to produce required information services. They move beyond raw technology to include the human capability needed to interact with the system and deliver meaningful outputs.

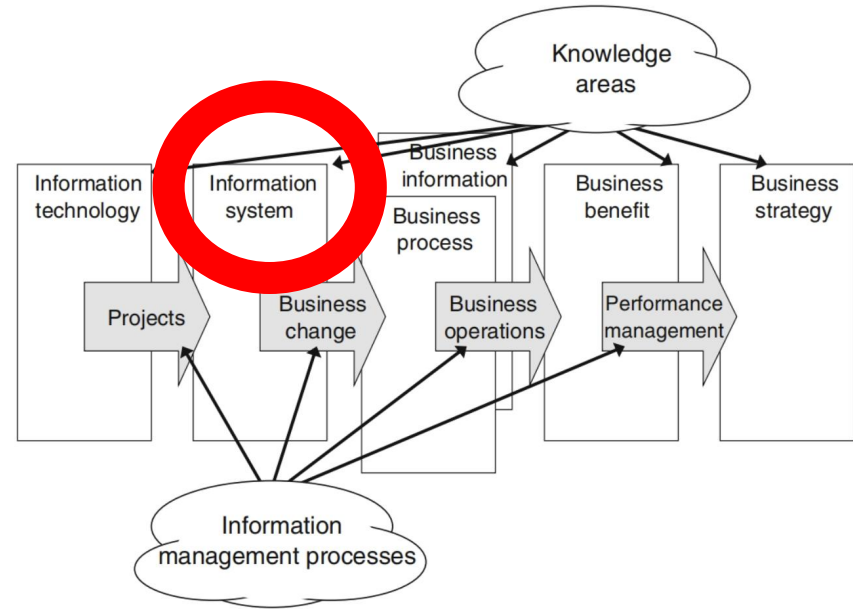

Fig. 2.2 Six management domains, four intersections of necessary alignment

Business Process

These are high-level, cross-functional activities, such as "customer order fulfillment," that deliver specific outcomes valued by stakeholders. They serve as logical envelopes that coordinate lower-level business activities to achieve purpose and direction.

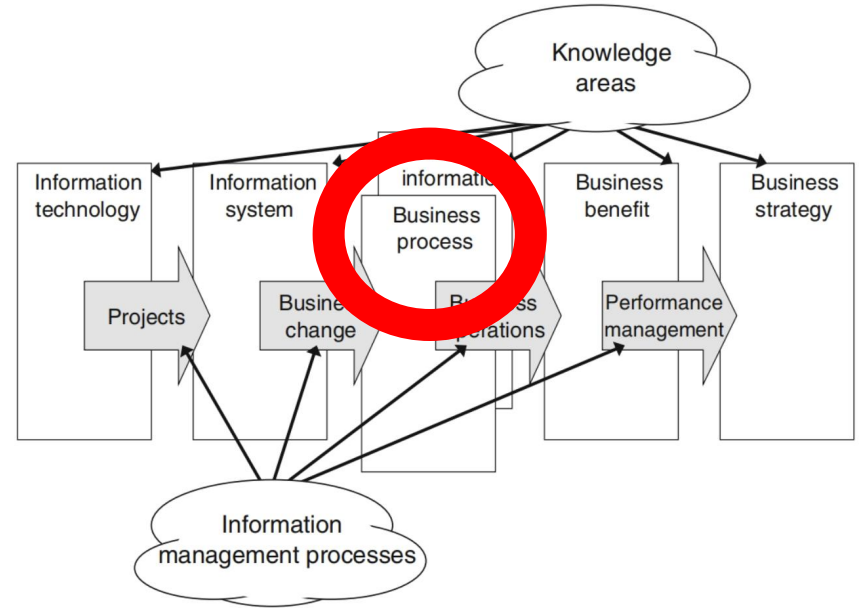

Fig. 2.2 Six management domains, four intersections of necessary alignment

Business Information

This domain focuses on interpreting data to enable informed business decisions and structuring that data effectively within databases. It involves determining specific information needs so that data becomes a valuable asset for management control and routine operations.

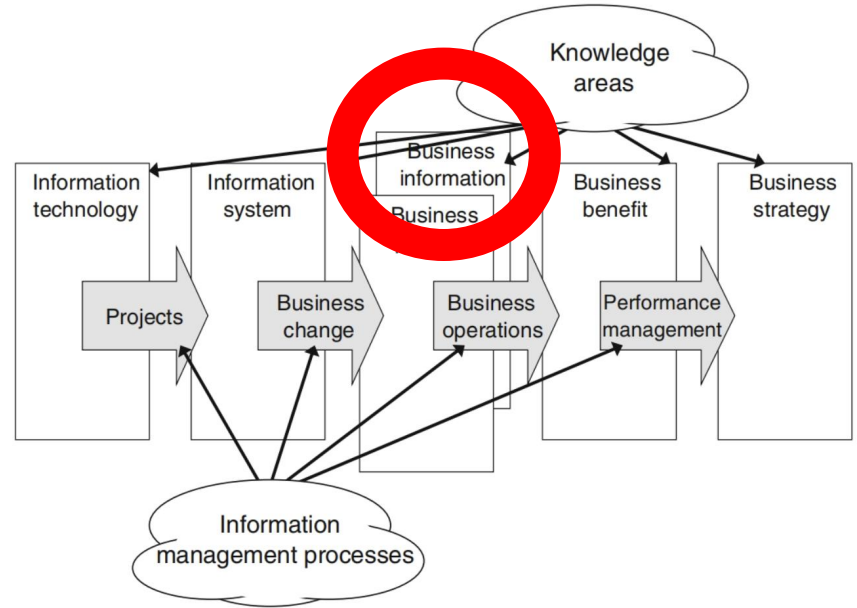

Fig. 2.2 Six management domains, four intersections of necessary alignment

Business Benefit

This area is concerned with identifying and measuring the actual value and performance improvements derived from IT investments. It requires proactive management to ensure that the promised improvements in business practice are realized and demonstrated to senior management.

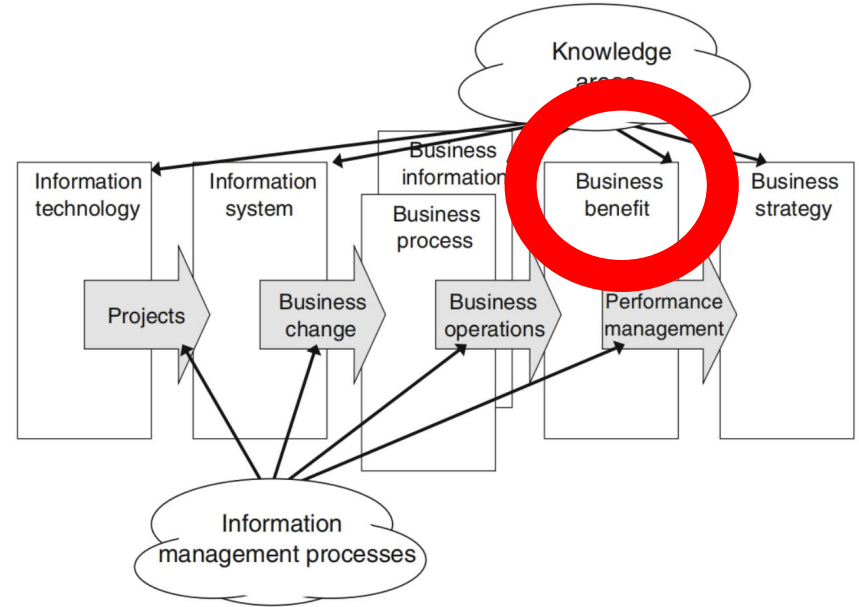

Fig. 2.2 Six management domains, four intersections of necessary alignment

Business Strategy

Business strategy provides the high-level direction, mission, and targets set by senior management to guide the organization's efforts. While formulating these strategies is often straightforward, implementing them effectively throughout the business remains a significant managerial challenge.

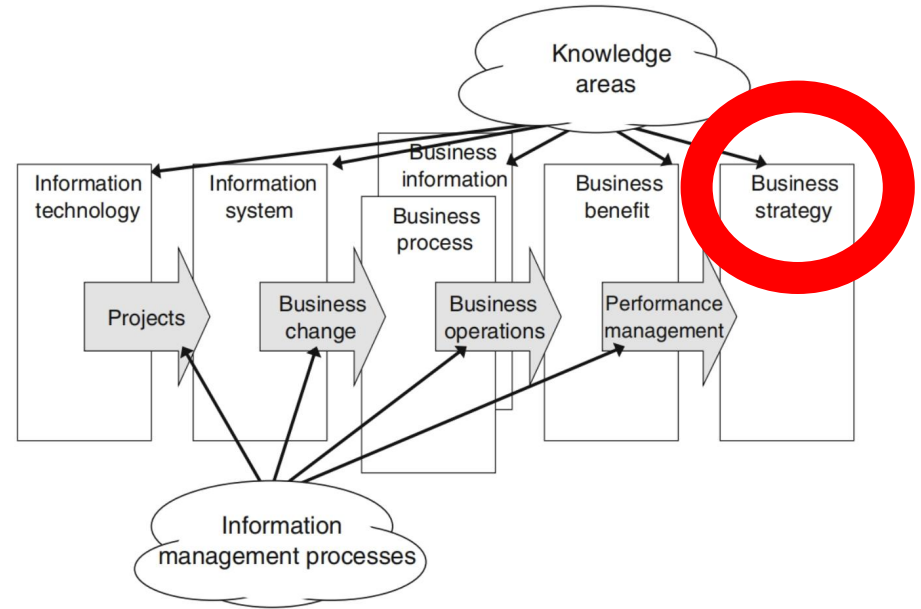

Fig. 2.2 Six management domains, four intersections of necessary alignment

Suppose this

- We know all about the six knowledge areas.
- We have experts who know all about the technologies that we use.
- We have competent systems development staff that can work reliably to deliver good systems that meet the specification of the requirements.
- Functional management in the main business areas is strong and amenable to change, and the senior management team is well informed and sets reasonable targets.

Things can still go wrong. The problem lies in the migration of ideas and information management value from one area of competency to another.

Projects

Projects are the management processes used to engineer raw information technology into workable information systems that meet business requirements. They are temporary endeavors focused on delivering specific outputs within defined tasks, milestones, and budgets.

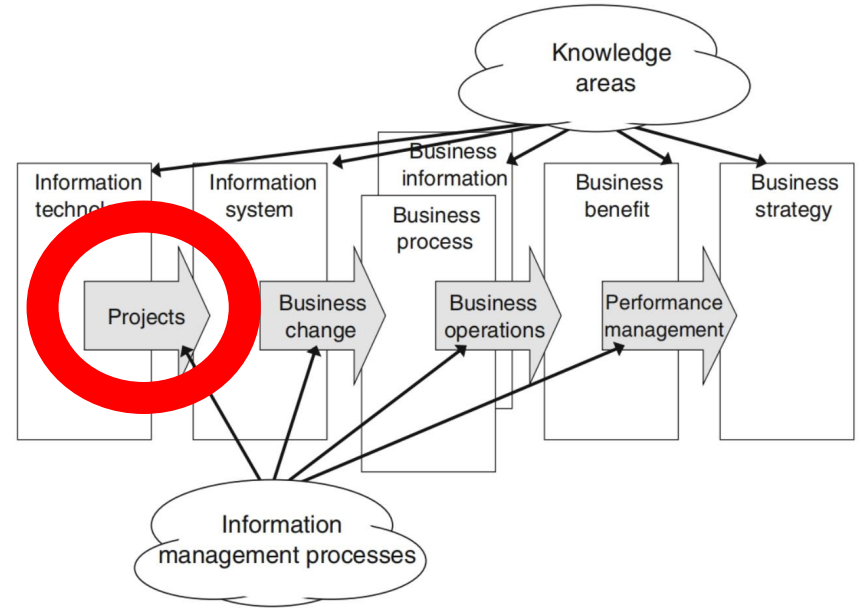

Fig. 2.2 Six management domains, four intersections of necessary alignment

Business Change

This process involves the difficult task of changing how people work to successfully exploit and find value in new information systems. It bridges the gap between system delivery and operational use, requiring careful management of human behaviors and organizational structures.

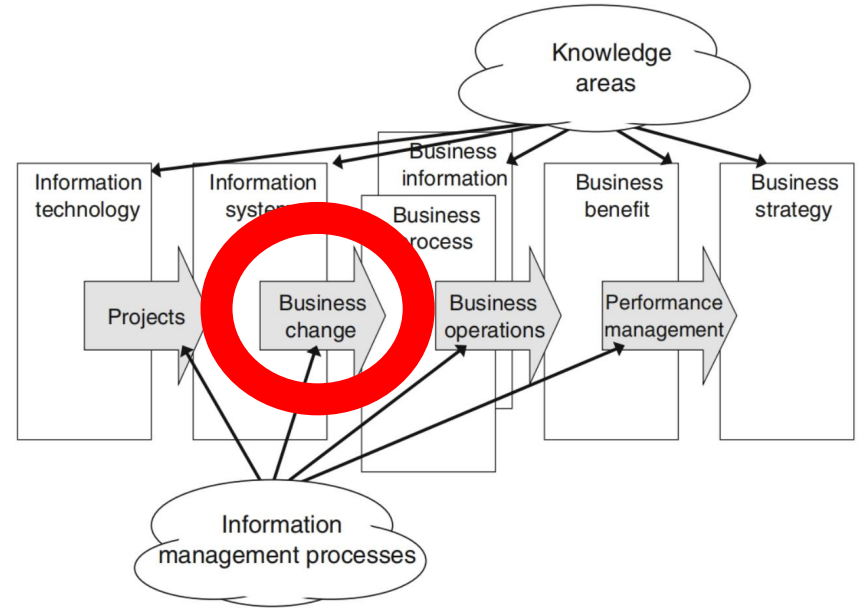

Fig. 2.2 Six management domains, four intersections of necessary alignment

Business Operations

Business operations represent the organization at work, producing goods and services and delivering value to customers. This process is where improved business information and processes are executed to earn revenue and meet expected performance levels.

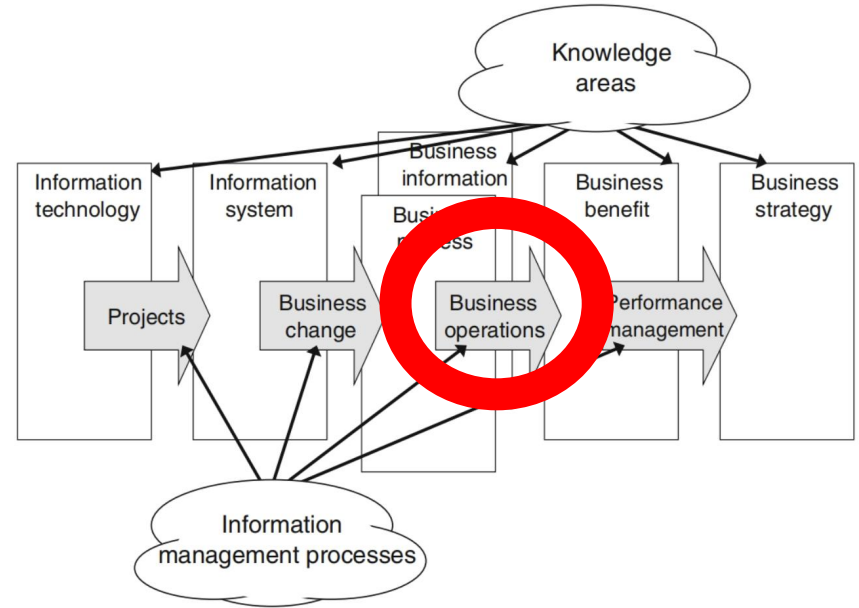

Fig. 2.2 Six management domains, four intersections of necessary alignment

Performance Management

This process is where business systems meet business strategy to verify that the intended benefits of an investment are actually delivered. It involves striving to balance financial success with internal efficiency, customer satisfaction, and organizational learning.

An Example

The Context

- A gym wanted its members to be able to enter inside by proving their identity.
- Their identity should be linked to their account within the gym's system.

Activity
